

Applying on website creates login for app.
Can create account on app, writes to same login database

Email script tears apart documents and databases fields
Login info and document info have firewall between them.
Login Database feeds the app profile information. Users can change their login info, and it writes back to the login database only.

To build a pass
App calls doc database for document info, and uses pre-called login information to fill name fields. You cannot write back to the document database, only call from it.

Document database creates and holds personalized qr code to match name in doc database
. Document database delivers only selected fields to passbuild tool/ database.

Final check is to make sure the name info in app matches the name info in database, other wise no pass issued.
